## SmartDeal Architecture

## Firestore Schema

-----

- \* \*\*Rules\*\* collection contains 'triggerType', 'threshold', and 'enabled' fields.
- \* \*\*Deals\*\* collection stores promotions with price, discount and location data.
- \* \*\*Analytics\*\* collection logs events with 'dealld', 'userld', 'type', and 'date'.
- \* \*\*Notifications\*\* collection keeps notification text and read state per user.

## **Cloud Functions**

-----

- \* \*\*evaluateSmartDeals\*\* scores deals via HTTPS callable function.
- \* \*\*generateAlSmartDealSuggestion\*\* suggests deals based on keywords.
- \* \*\*dispatchNotifications\*\* moves approved deals and sends FCM messages.

## Interfaces & QR Redemption

-----

The iOS client displays deals and uses a QR scanner to redeem purchases. A React admin dashboard can review pending deals and tune rules. QR codes map to 'purchase' documents and redemption marks them as used in Firestore.
